Programming Exercise 8B

NOTE: **All programs that you write must have comments at the top with 1) the program name, 2) your name, and 3) a sentence describing what the program does.**

1. In Lab8A1, 2, & 3 you created GUI windows that input data from the user in input boxes and had a button that the user clicked to start the calculation (or type the data in the input box and press Enter.) Then the result would be displayed in another text box.

2. For Lab8B1 & Lab8B2 you should find different formulas to be calculated with one or more pieces of data from the user. (Choose something different than those in Lab8A.)
   Do the same type of thing that you did in the Lab8A programs.
   It should have one or more number input boxes for the input data for the formula.
   It should also have a command button.
   When the user clicks the button or types the data in the input boxes and hits Enter, then the result should be printed in an output text box.
   So, Lab8B1 will have one formula with its corresponding input data and result, and Lab8B2 will have a completely different formula and data of its own.
